

Changing the Radiator and Fan in Star CCM+

Caleb Kopitsky

How the Radiator/Fan are Modeled

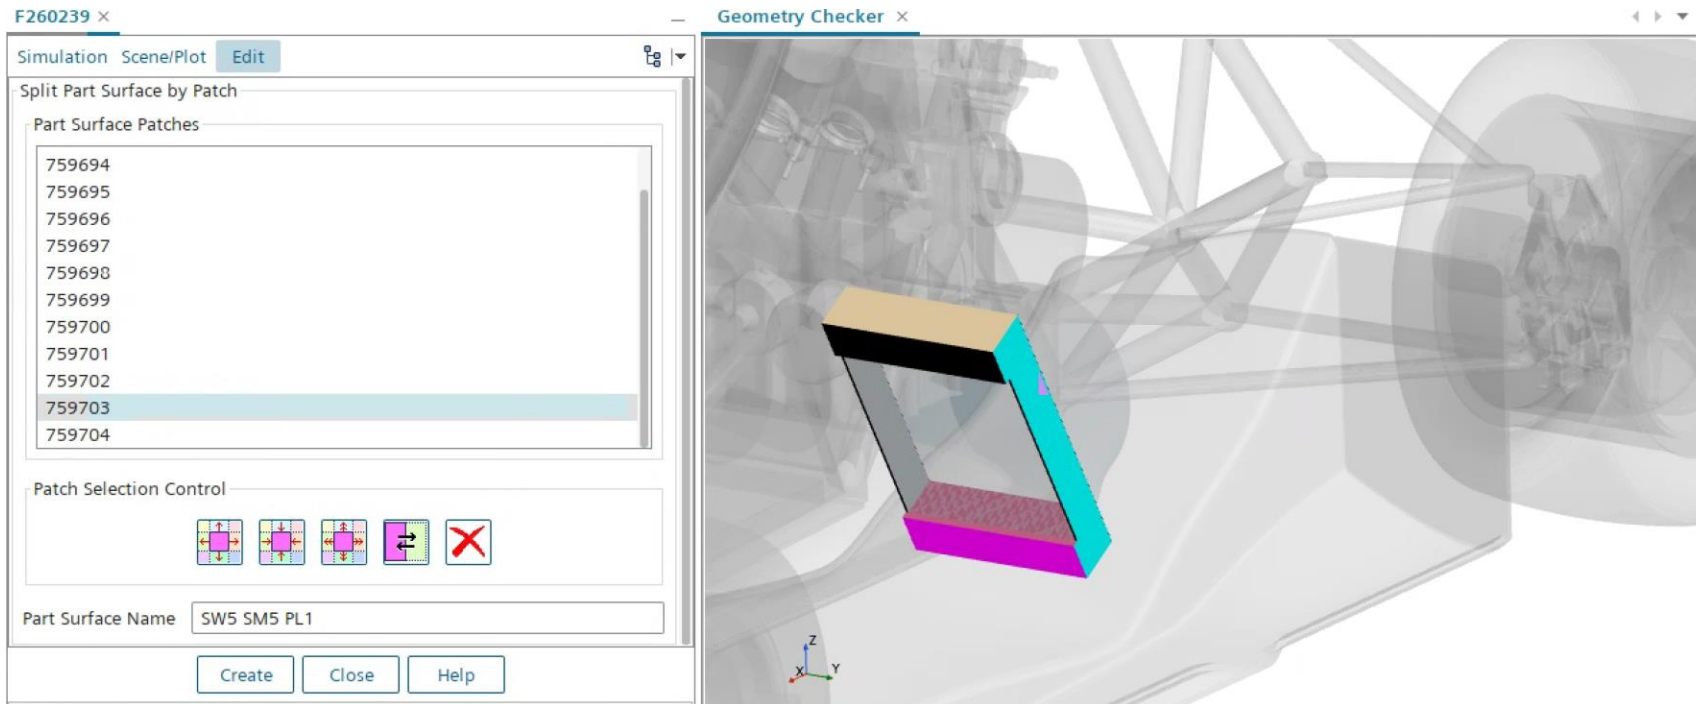

The fan and radiator are each defined as their own volumetric (3D) enclosed regions, with a common interface.

To model the radiator and fan in CAD, create either solid bodies or fully enclosed surface bodies and import them into Star as you would any other part.

Creating Surfaces From Imported CAD

Whether imported as a solid body or enclosed surface body, the surfaces making up these bodies must be split to define the boundaries of the regions.

To do this, right-click the body in the Geometry Checker and hit "Split by Patch". Select a boundary, such as the upstream face, and name it "Upstream", then hit Create. Do this for the remaining boundaries. Surfaces not created this way will be saved as a single surface. For example, if the imported radiator body is a rectangle, and the inlet and outlet faces are created, the remaining surfaces which make up the walls which be saved as a single surface.

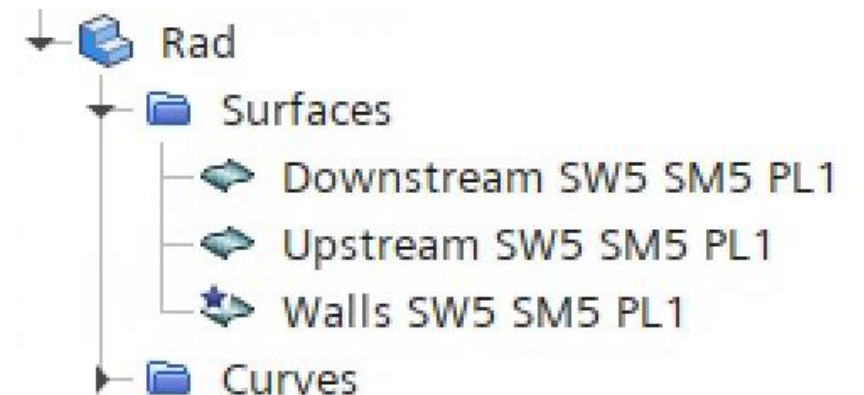

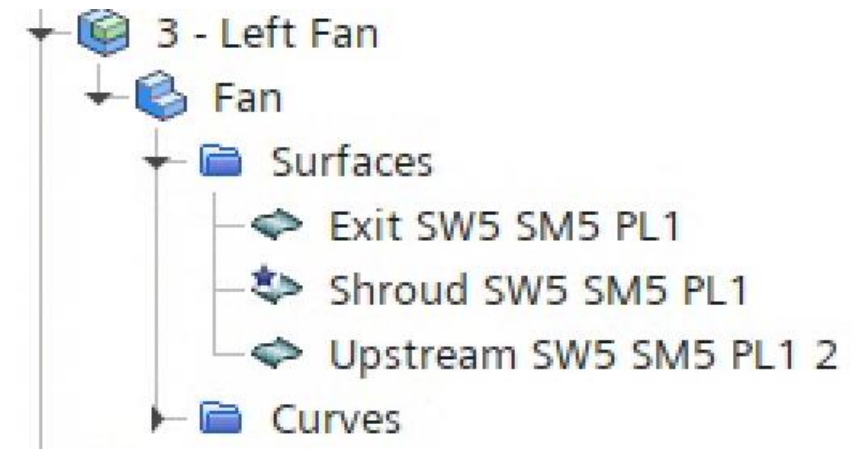

Defining Surfaces in Star

Surfaces must be named appropriately for Star to define the region.

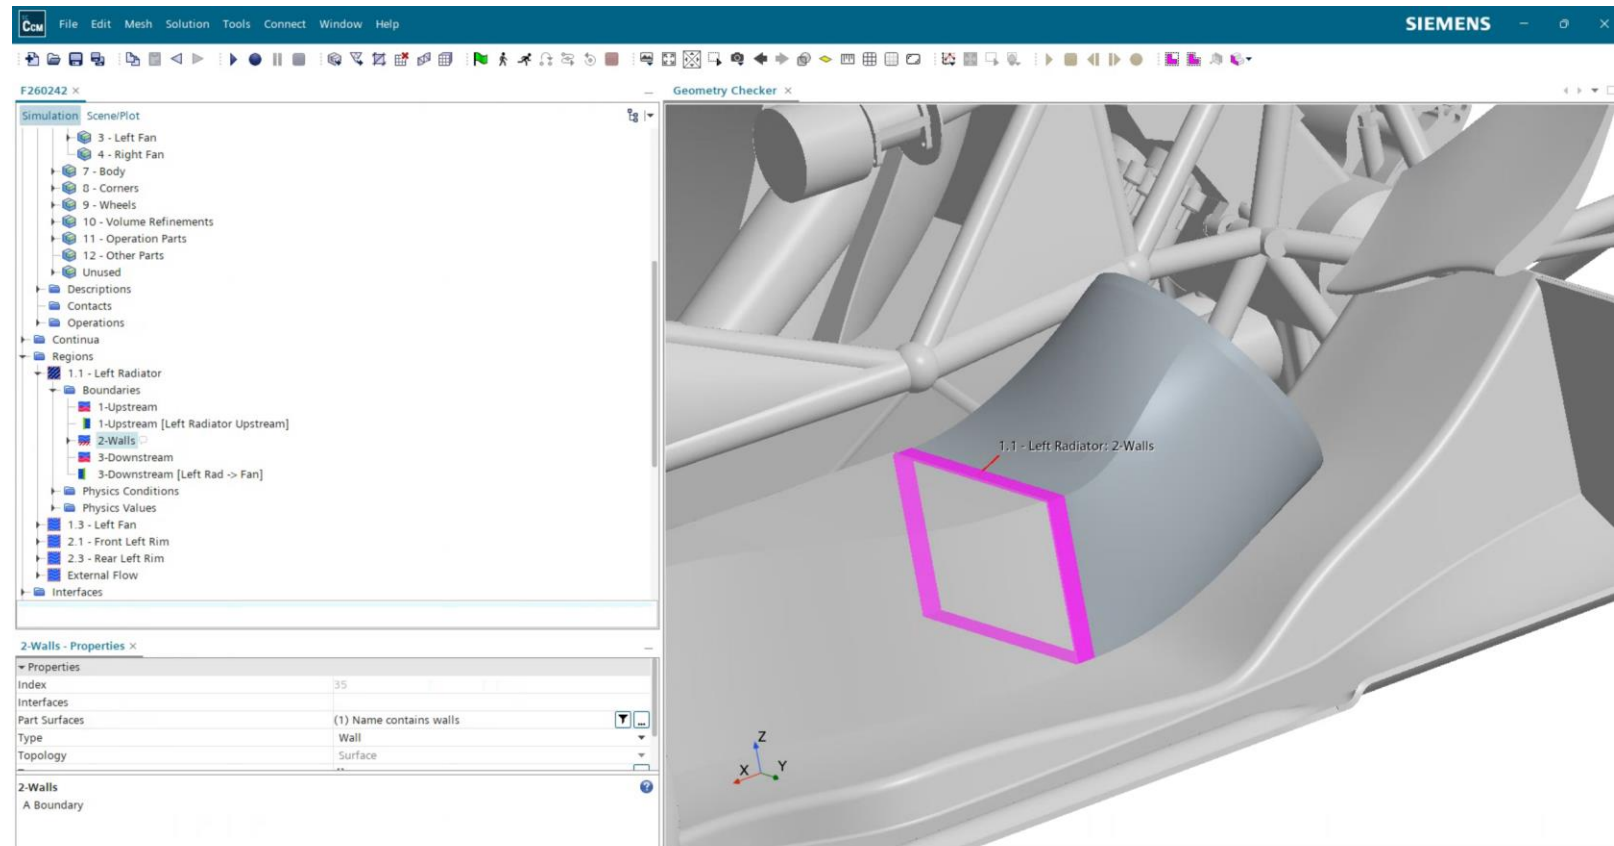

In the left plane, under Geometry -> Parts -> Radiators, ensure the radiator and fans have the names as shown.

Star automatically will select surfaces with these names, from these parts, for the necessary Regions. This means the mesh settings may be changed.

Checking Boundaries

To check whether the boundaries have been defined correctly, click on them in the left-panel tree. The surface should be highlighted pink.

Defining Interfaces

Without an interface, the Mesher will have two coincident surfaces and will fail. The interface may be defined by selecting the Rad Downstream boundary and Fan Upstream boundary, right-clicking, and selecting "Create Interface."

The interface should now appear in the left-panel tree under the interfaces folder. Rename it to "Left Rad -> Fan" for consistency. If another interface already exists of the same name, delete it.

To check whether it has been defined properly, click it and the surface should highlight in yellow.
